1. Executive Overview & Scope

The testing scope evaluated all interactive facets of the Jewellery Mate royal e-commerce platform. Test suites covered three user archetypes: **Guest Shopper**, **Registered Customer**, and **Administrator**. Scenarios spanned responsive desktop (1440×900), tablet (768×1024), and mobile viewports (375×812), catalog browsing across 5 luxury categories, real-time pincode serviceability checks, shopping bag state persistence, end-to-end Cash on Delivery (COD) order placement, Razorpay payment gateway simulation, order tracking timeline lookups, customer account registration with duplicate validation, administrative portal security, and backend API contract integrity.

2. Discovered Defects, Root Causes & Resolutions

BUG-01: Unauthenticated Guest Access to Store Admin Console (/admin/*)

SEVERITY: CRITICAL

Module: Admin Portal • **Root Cause:** `app/admin/layout.tsx` rendered admin navigation without verifying session cookie or redirecting unauthenticated visitors to `/admin/login`.

An unauthenticated visitor navigating directly to `/admin` could inspect revenue metrics, order quantities, and catalog data without entering the admin password.

✓ **Fix Implemented & Verified:** Created `/api/admin/auth/me`, added authorization verification in `app/admin/layout.tsx`, and enforced server-side redirect guard via `checkAdminSession()` in `app/admin/page.tsx`. Retested via **TC-28**: unauthenticated visitors are immediately halted and redirected to `/admin/login`.

BUG-02: Unprotected Administrative Mutation Endpoints (/api/admin/*)

SEVERITY: HIGH

Module: Backend API Security • **Root Cause:** While settings endpoints enforced `checkAdminSession()`, endpoints in `orders/route.ts`, `products/route.ts`, `slider/route.ts`, and `sync/*` allowed unauthenticated operations.

Raw customer personal data and order records could be extracted by unauthenticated GET requests, and catalog products could be inserted or patched without credentials.

✓ **Fix Implemented & Verified:** Injected `checkAdminSession()` guard returning `401 Unauthorized` across all administrative routes. Verified via **TC-40**.

BUG-03: Soft Navigation Cart State Desync on Checkout Submission

SEVERITY: MEDIUM

Module: Checkout Flow • **Root Cause:** `router.push(data.redirectUrl)` failed to perform an atomic flush of cart state across all client browser windows upon order completion.

Upon order completion, stale in-memory cart states occasionally lingered or failed to navigate reliably in automated browser environments.

✓ **Fix Implemented & Verified:** Upgraded navigation callback to deterministic `window.location.href = data.redirectUrl` in `app/checkout/page.tsx`, guaranteeing atomic cart clearing, confetti trigger, and redirection to `/order-success/[orderNumber]`. Retested via **TC-18**.
